-1- FUNCTION: NEUROEXCITATORY PEPTIDE; INCREASES THE IMPULSE FREQUENCY
AND PRODUCES A SPIKE BROADENING OF THE IDENTIFIED HEART EXCITATORY
NEURON (PON); ALSO ENHANCES THE AMPLITUDE AND FREQUENCY OF THE
HEART BEAT. HAS ALSO AN EFFECT ON SEVERAL OTHER MUSCLES.
PIR; A32480; A32480.

"The expansion behaviour of sea anemones may be coordinated by two inhibitory neuropeptides, Antho-Kaamide and Antho-Riamide.";
Proc. R. Soc. Lond., B. Biol. Sci. 253:183-188(1993).
-!- FUNCTION: Inhibits spontaneous contractions in several muscle groups. May be involved in the expansion phase of feeding behaviour in sea anemones.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Neuron-specific.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MEDLINE-92195954; PubMed-1686933;

"The expansion behaviour of sea anemones may be coordinated by two inhibitory neuropeptides, Antho-Khamide and Antho-Rlamide."; Proc. R. Soc. Lond., B, Biol. Soi. 233:183-188(193).
-!- FUNCTION: Inhibits spontaneous contractions in several muscle groups. May be involved in the expansion phase of feeding behaviour in sea anemones.
-!- SUBCELDULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Neuron-specific.
                                                                                                                                                                                                                           ;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 12, Application US/08406192
Patent No. 5739287
GENERAL INFORMATION:
PAPLICANT: Wilbur, D. Scott
APPLICANT: Prathare, Pradip M
TITLE OF INFORMATION:
NUMBER OF SEQUENCES: 47
CORRESPONDENCE ADDRESS:
ADDRESSEE: Christensen, O'Connor, Johnson and Kindness
STREET: 1420 Fifth Avenue, Suite 2800
CITY: Seattle
STATE: Washington
COUNTRY: US.A.
ZIP: WA 98101-2333
COMPUTER: RADABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CUASSIFICATION NUMBER: US/08/406,192
FILING DATE: 16-MAR-1995
CLASSIFICATION NUMBER: US 08/224,831
FILING DATE: 08-APR-1994

Patent No. US20020015678A1
GENERAL INFORMATION:
APPLICANT: Yuan, Zheng-Xiao
TITLE OF INVENTION:
TITLE OF INVENTION: For Measuring Enzyme Activity and Assay
TITLE OF INVENTION: Processes
FILE REFERENCE: 342312000600
CURRENT APPLICATION NUMBER: US/09/248,158
CURRENT FILING DATE: 1999-02-09
PRIOR PILING DATE: 1999-02-09
PRIOR FILING DATE: 1998-02-10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                     8
                                                                                                                                                                                                                           ö
                                                                        The present peptide represents a proteinase site used in the creation of the bone morphogenetic fusion proteins of the invention. The bone morphogenetic fusion protein may contain some or all of the following elements: a purification tag a proteinase site, an ECM/bone binding site, a second proteinase site, and a bone morphogenetic protein active fragment. The fusion proteins of the invention also includes proteins that have transforming growth factor beta active fragments instead of bone morphogenetic protein active fragments. The bone morphogenetic fusion proteins can be used for enhancing wound healing
                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New conantokin peptide(s) - useful for e.g. treating neurologic or psychiatric disorders, or the management of pain
                 New bone morphogenetic fusion proteins - comprising a purification tag and a bone morphogenetic active fragment, used for enhancing wound healing or bone growth
                                                                                                                                                                                                                                                                                                                                                                                             Conantokin, predatory cone snail; treatment; neurologic disorder; psychiatric disorder; anticonvulsant; neuroprotective; analgesic. HIV infection; ophthalmic indication; memory; learning defect;

The present sequence is a conantokin peptide derivative, which can be used to treat neurologic and psychiatric disorders, e.g. as an anticonvulsant, neuroprotective or analysesic agent. Neurologic and psychiatric disorders include epilepsy, convulsions, neurotoxic or psychiatric disorders include epilepsy, convulsions, neurotoxic injury (associated with conditions of hypoxia, anoxia or ischaemia, which typically follow stroke, cerebrovascular accident, brain or spinal cord trauma, myocardial infarct, physical trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic events), curvodegeneration (associated with Alzheimer's disease, senile dementia, Amyotrophic Lateral Sclerosis, Multiple Sclerosis, Parkinson's disease, Huntington's disease, Down's Syndrome, carkinson's disease, schizophrenia, AlDS dementia, multiple sclerosis, worthing, Binswanger dementia and neuronal damage associated with uncontrolled seizures), chemical toxicity (such as addiction, and monotrolled seizures), chemical toxicity (such as addiction, and controlled seizures), chemical toxicity (such as addiction, manic-depression, disorder, muscle relaxation and urinary incontinence. The peptide can also be used to treat HIV infection, ophthalmic propertion and memory, learning or cognitive defects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Conantokin; predatory cone snail; treatment; neurologic disorder; psychiatric disorder; anticonvulsant; neuroprotective; analgesic. of cone smalls. They are used for the treatment of disorders in which excitation of marked in which excitatory amino acids or agonist of N-methyl-D-aspartate (NMDA) receptor. The conancokin peptides are used for the treatment of disorders such as pain; neurologic or psychiatric disorders such as pain; neurologic or psychiatric disorders such treatment of hypoxia, anoxia or ischemia; for treating neurodegeneration; for hypoxia, anoxia or ischemia; for treating neurodegeneration; for abuse, morphine, opioid and barbiturate tolerance; for treating psychiatric disorders such as anxiety, major depression, manic-depression illness, obsessive compulsive disorder, schizophrania or mood disorder; for treating odditional neurological disorders e.g. dystonia, sleep disorder; muscle relaxation and urinary incontinence; for memory/cognition enhancement; for treating HIV
                                                                                                                                                                                                                                                                                                                                                                   AAG79012-43 and AAG790054-56 represent domains of conantokin peptides. Conantokins differ from conotoxins, in that they contain gamma-carboxyglutamic acid. The conantokins are derived from the venom
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                             Use of conantokin peptide or its derivatives or a conantokin peptide chimera for treating disorders e.g. migraine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         spasmodic dysphonia, laryngeal dystonia, muscular tension, asthma, neuralgia, autonomic nervous system disorder; sweating, salivation, headache, neuropathy, botulinum toxin serotype A; BoNT/A.

                                                                                                               Clostridial botulinum toxins with altered biological persistence.

These toxins comprise a structural modification which is effective to alter the biological persistence. Modified neurotoxins of the invention are used for treating biological persons which include neuromuscular disorder e.g. strabismus, blepharospasm, spasmodic torticollis (cervical dystonia), oromandibular dystonia and spasmodic dysphonia (laryngeal dystonia), autonomic nervous system disorders e.g. excessive salivation and sweating, asthma etc. and pain e.g. headache, muscular tension, neuralgia and neuropathy. The present sequence is botulinum toxin sercype A (BONT/A) N-glycosylation site. This peptide is derived from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Soybean; diverged delta-9 fatty acid desaturase; enzyme; cellular lipid; oil; transgenic plant; gene mapping; immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to diverged delta-9 fatty acid desaturase proteins and polynucleotides encoding such proteins. The nucleic acid sequences may be used to increase the level of unsaturation in cellular lipids, including oil, in tissues when the enzyme is absent or rate-
                   Modified neurotoxin especially Clostridial toxins, useful for treating neuromuscular and autonomic nervous system disorder and pain, comprises structural modification to alter biological persistence of neurotoxin
                                                                                                                                                                                                                                                                                                           Gaps

limiting, to isolate cDNAs and genes encoding homologous proteins from the same or other plant species and to create transgenic plants in which the polypeptides are present at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found, thus altering the level of mnon-, poly- and unsaturated fatty acids in those cells. They are useful as probes for genetic and physical gene mapping and as markers, e.g. restriction fragment length polymorphism (RFLP) markers. The peptides can be used to immunise animals to produce antibodies specific for the peptides and proteins. The present sequence is soybean diverged delta-9 fatty acid desaturase peptide (residues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             useful for

fragmenting at least a first protein sample and second protein sample to produce a first pretein sample and a second protein sample to produce a first peptide pool and a second peptide pool; sample to produce a first peptide pool and a second peptide pool; so the pool as to permit resolution of the pool; and the pool as to permit resolution of otherwise identical peptides in the first and second peptide pools by mass analysis; contacting peptides from at least a portion of both of the peptide pools with a capture moiety to yield affinity-selected peptides comprising an affinity ligand, where the capture moiety selects for the second samples. The method of the invention is useful for identifying one or more proteins in the sample, and is typically useful for identifying multiple proteins in a single complex mixture. The method is also useful for quantifying proteins in a sample or several samples. The advantages for the novel method are that it is easier to separate peptides than proteins; native structure of the protein does not have to be maintained contact the protein service of the protein does not interfere; and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                               protein or obtaining its composite peptide signature. The present sequence is C-terminal fragment of a differentially acetylated arginine-containing peptide which is used to generate fragment ions for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to an antibody specific for (-5,-6 and -7)-proPSA (prostate-specific antigen), but with no reactivity with (-4)
    employing mass spectrometric analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            prostate-specific antigen; prostatic carcinoma; pro-kallikrein 2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antibody comprising specificity for some truncated forms of pro-prostate specific antigen, useful in immunoassays for differential

or shorter forms of the protein. The antibody can be used to diagnose prostatic carcinoms and to detect human pro-kallikrein 2. The present sequence is a peptide which forms part of a peptide-containing immunogen described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to an antibody specific for (-5,-6 and -7)-proPSA (prostate-specific antigen), but with no reactivity with (-4) or shorter forms of the protein. The antibody can be used to diagnose prostatic carcinoma and to detect human pro-kallikrein 2. The present sequence is a peptide which forms part of a peptide-containing immunogen described in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WO200272778-A2.
                                                                                                                                                                                                                                                                                                                                                                                                                   Unidentified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          19-SEP-2002
ABJ36806;
The invention relates to a novel method for identifying a G protein coupled receptor (GPCR) signaling inhibitor. The novel method comprises selecting or identifying a member of a library of peptides and/or candidate compounds, having binding to a GPCR of higher affinity than that of the native peptide. The peptide library is based on a native GPCR binding peptide. The method is useful for identifying inhibitors of a G protein coupled receptor (GPCR) signaling. The method is particularly useful for identifying drugs that antegonise the binding between a GPCR and its extracellular ligand(s). The method is especially useful in modern high throughput screening assays for identifying potent lead compounds. The compounds, peptides or inhibitors identified by the method are useful for preventing, ameliorating or treating diseases in which GPCR signaling is a causative factor or in which a specific class of GPCR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     protein is relevant, e.g. stroke, myocardial infarction, restenosis, atherosclerosis, hypotension, cancers, infections, septic shock, pain, allergic disorders, asthma, inflammatory bowel disease, osteoporosis, obesity, or psychotic and neurological disorders (e.g. anxiety, schizophrenia or Alzheimer's disease). This sequence represents a peptide relating to the G protein coupled receptors of the invention.
                                                                                              Nootropic; cardiant; antiarteriosclerotic; hypotensive; cytostatic; antibacterial; analgesic; antiallergic; antiasthmatic; antinflammatory; sosteopethic; neuroprotective; anxiolytic; ancettic; lead compound; g protein coupled receptor signaling inhibitor; GPCR; library; high throughput screening assay; stroke; myocardial infarction; restenosis; atherosclerosis; hypotension; cancer; infection; asthma; septic shock; pain; allergic disorder; inflammatory bowel disease; schizophrenia; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying G protein coupled receptor (GPCR) signaling inhibitors, useful in screening drugs for treating stroke, cancers or pain, by identifying compounds that block GPCR mediated signaling with high affinity and specificity -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           81.8%; Score 9; DB 24; Length 4; 66.7%; Pred. The invention relates to a novel method for identifying a G protein coupled receptor (GPCR) signaling inhibitor. The novel method comprises selecting or identifying a member of a library of peptides and/or candidate compounds, having binding to a GPCR of higher affinity than that of the native peptide. The peptide library is based on a native GPCR binding peptide. The method is useful for identifying inhibitors of a G protein coupled receptor (GPCR) signaling. The method is particularly useful for identifying staticularly useful for identifying optimic and its extracellular ligand(s). The method is especially useful in modern high throughput screening assays for identifying potent lead compounds. The compounds peptides or inhibitors identified by the method are useful for preventing, ameliorating or treating diseases in which are useful for preventing, ameliorating or treating diseases in which are useful for preventing, cancers, infections, septic shock, pain, atherosclerosis, hypotension, cancers, infections, septic shock, pain, atherosclerosis, hypotension, cancers, infections, septic shock, pain, obesity, or psychotic and neurological disorders (e.g. anxiety, cobesity, or psychotic and neurological disorders (e.g. anxiety, callarging to the G protein coupled receptors of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

GABA; neurotransmitter transporter;

Covalently linked complex for tumour treatment - comprises treating with protein, cytotoxic agent and enhancing moiety.

Claim 13; Page 22; 23pp; English.

```
The invention describes an isolated human transporter peptide (I) that
is related to the gamma-aminobutyric acid (GABA) neurotransmitter
transporter subfamily. (I) and the nucleic acid encoding it (II) can be
used as models for the development of human therapeutic targets, aid in
the identification of therapeutic proteins and serve as targets for the
development of human therapeutic agents that modulate transporter
activity. (I) is used to raise antibodies or to elicit another immune
response, as a reagent in assays designed to quantitatively determine
levels of the protein in biological fluids, and as markers for tissues
in which the corresponding protein is preferentially expressed. The
transporter proteins isolated from humans and their human/mammalian
orthologues serve as targets for identifying agents for use in mammalian
transporter subfamily. The proteins and peptides also provide a target
for diagnosing a disease or predisposition to disease mediated by the
peptide, and are useful for treating a disorder characterised by absence
of, inappropriate, unwanted or altered expression of the protein. The
antibodies are also useful for assessing normal and aberrant subcellular
clocalisation of cells in various tissues in an organism, in
pharmacogenomic analysis, for tissue typing and for inhibiting protein
tunding transgenic animals; for tuse typing and for inhibiting protein
thannels.

This is the amino acid sequence of a polypeptide related to the novel human aminobutyric acid (GABA) transporter related protein.

                                                                                                                                                                                                                                                                                                                           attached to the C-terminus of an anchoring moiety which in turn is linked to a targeting protein and a cytotoxic agent. When the anchoring peptide intercalates into the target cell plasma membrane the accessory moiety is translocated across the membrane and protrudes into the cytoplasm. It can then be phosphorylated by cellular kinases at neutral pH. This irreversibly anchors the complex to the membrane and may enhance the translocation into the cytoplasm. The complex is useful for treament and diagnosis of tumours.
                                                                                                                                                                                                                                                                                                                   The sequence is one of several possible accessory moieties which can be

New antigenic molecules derived from growth hormone - and derived antibodies, used to stimulate the activity of growth hormone
                                                                                                                                                                                                              This peptide corresponds to residues 92-96 of bovine, ovine and porcine growth hormone. The peptide is rendered antigenic and is then capable of stimulating the production of antibodies which, when in the appropriate formulation, potentiate the effect of
                                                                                                                                                                                                                                                                                                                growth hormone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nEPOR is wild-type EPOR. CEPOR is a constitutive EPOR. It contains a point mutaion (a transition from C to T at nuclectide 484) which causes one substitution (Arg to Cys) in the exoplasmic domain of EPOR at codon 129 of the predicted N-terminus. The ARg to Cys point mutation in CEPOR is sufficient to induce factor-independent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bovine, ovine, porcine, growth hormone, bGH; oGH; pGH; antigen, growth hormone activity; potentiate, enhance; increase.

"Purification and N-terminal sequencing of a 3 kDa antibacterial peptide from skin secretions of rainbow trout."; Submitted (MAY-2002) to the SWISS-PROT data bank.
-!-FUNCTION: Has antibacterial activity against Gram-positive bacterium P.citreus.
-!-SUBCELLULAR LOCATION: Secreted.
-!-TISSUE SPECIFICITY: Skin.

Biochem. Physiol. 95B:773-779(1990).

-I-FUNCTION: Lysozymes have primarily a bacteriolytic function; those in tissues and body fluids are associated with the monocytemacrophage system and enhance the activity of immunoagents.

-I-CAPALYTIC ACTIVITY: Hydrolysis of the 1,4-beta-linkages between Nacetyl-D-glucosamine and N-acetylmuramic acid in peptidoglycan acetyl-D-glucosamine and N-acetylmuramic acid in peptidoglycan
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

It acts rapidly on both peptide-substituted and unsubstituted acts rapidly on both peptide-substituted and unsubstituted peptidoglycan, and slowly on chitin oligosaccharides.
-i- SIMILARITY: Belongs to family 22 of glycosyl hydrolases.

-- FUNCTION: Hydrolyzes PPi generated in anabolic reactions.
-- CATALYTIC ACTIVITY: Diphosphate + H(2)0 = 2 phosphate.
-- COPACTOR: Requires the presence of divalent metal cation.
Magnesium confers the highest activity. Binds 4 divalent cations per submit (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

RT Grambanco I., Blanchi V., Donato R.;

RT expressed in glioma cell lines and its expression depends on cellular growth state.,

T. FEBS Lett. 290:131-134(1991).

C. I- FUNCTION: UBIQUITIN-PROTEIN HYDROLASE IS INVOLVED BOTH IN THE FROCESSING OF UBIQUITIN-PROTEIN HYDROLASE AND OF UBIQUITING.

THIS ENZYME IS A THIOL PROTEASE THAT RECOGNIZE AND HYDROLYZE

C. A PREPIDE BOND AT THE C-TERMINAL GLYCINE OF UBIQUITIN.

C. CATALYTIC ACTIVITY: Ubiquitin C-terminal thiolester + H(2)O = ubiquitin + a thiol.

C. CATALYTIC ACTIVITY: Ubiquitin C-terminal thiolester + H(2)O = ubiquitin + a thiol.

C. CATALYTIC STRUCTION: Cytoplasmic.

C. SIMILARITY: BELONGS TO PEPTIDASE FAMILY C12.

PIRS SIPELS SINCHINGS TO PEPTIDASE FAMILY C12.
